INTEROFFICE MEMORANDUM

To: Interested Parties
From: Toxicology Division
Chief Engineer's Office
Subject: December 2010 Effects Screening Levels

Date: December 29, 2010

Attached is the latest update of the list of Effects Screening Levels (ESLs) currently used by the TCEQ Toxicology Division for air permitting. This update replaces the list released on October 12, 2009. ESLs, expressed in terms of microgram per cubic meter ($\mu\text{g}/\text{m}^3$) or parts per billion by volume (ppbv) in air, are used to evaluate potential for effects to occur as a result of exposure to concentrations of constituents in the air. ESLs are based on data concerning health effects, odor/nuisance potential, and effects on vegetation. They are not ambient air standards. If predicted or measured airborne levels of a constituent do not exceed the screening level, adverse health or welfare would not be expected to result. If ambient levels of constituents in air exceed the screening level, it does not necessarily indicate a problem, but a more in-depth review is conducted.

We would like to call attention to several notations used on the list. Short-term ESLs are listed for each constituent. "Short-term" generally indicates a 1-hour averaging period. However, exceptions are noted parenthetically after the name of the constituent. "Long-term" indicates an annual averaging period. "Final" indicates that the ESL was updated using the revised ESL development guidelines (RG-442). "Under review" indicates that the ESL is currently being reviewed by the Toxicology Division. "Interim" indicates that the ESL is current and will be reviewed by the Toxicology Division at a later date. Also, interim ESLs can be updated pending the release of updated toxicity information or odor data. For any compound that is designated as particulate matter (PM), the compound will be evaluated on individual basis as PM10, unless otherwise noted. The total particulate matter represented in each permit evaluation must meet the National Ambient Air Quality Standard. For any constituent composed of at least 5% of benzene, benzene emissions will have to be modeled and evaluated separately.

If you cannot find a listing for a particular constituent, this does not mean a health effects review is not required. Please contact the Toxicology Division to determine if a screening level has been established for a constituent that is not in this list. We recommend that you use synonyms and CAS No.'s to insure that the constituent of interest is not listed prior to contacting the Toxicology Division. For any technical questions, please feel free to contact Angela Curry at 512-239-1306 or email at acurry@tceq.state.tx.us or Jong-Song Lee at 512-239-1790 or email at jlee@tceq.state.tx.us. Request for additional hard copies of the ESL list or a list of just the changes implemented in this update are available by calling Mary Lively at 512-239-1454.

Finally, all further updates regarding ESLs will be posted on the Toxicology Web page when available:
